# Dedication

Professor William Davies

This year's Annual Cruise is dedicated to Professor William A. Davies, head of the forest engineering department. Professor Davies is widely known and respected in professional circles and greatly admired by his students. Let us take this time to review the life and achievements of our senior FE advisor.

Life began for Bill in Seattle, Washington, where he received his primary and high school training. After graduation he worked in the woods on the rigging until he was involved in a speeder accident. This incident changed the course of his life. Instead of returning to the woods to set chokers, he decided to further his knowledge in forestry and to improve his technical abilities. He enrolled in logging engineering at the University of Washington where he graduated magna cum laude in 1938. While at Washington he was ranger of Xi Sigma Pi and a member of Sigma Xi and Phi Sigma honoraries.

Following graduation Bill worked for the U.S. Forest Service in timber sales and fire control. But soon private industry beckoned, and he went to work for the Weyerhaeuser Timber Company supervising cutting practices on logging contracts. Still not satisfied with his education, Bill returned to the University of Washington to acquire his Master's degree. In 1946 after writing a thesis on "Methods of Determining Tension in Logging Skylines", he received his degree.

Soon after, Bill moved, but this time to join the staff at Oregon State College. In 1951 he was appointed head of the FE department with the rank of full professor.

Since joining OSC he has spent three summers working for the Oregon Forest Products Laboratory on a survey of Lane County sawmills, and a study of decay in Douglas-fir. When not dangling salmon eggs in a nearby trout stream, Bill does considerable consulting forestry including work on McDonald forest and the Adair Tract.

In professional circles Bill has been active in the Society of American Foresters as a Student membership representative for the Columbia River Section and is a member of the Bureau of Land Management, Salem District Advisory Board. He has also served on several important committees in the Pacific Logging Congress. Along with all these activities he is responsible for the school's instruments and tools.

Bill is exceptionally conscious of his students' educational needs and has given his senior class considerable practical knowledge which he has acquired from his own experiences. Although he provides difficult courses of study, he is very understanding towards students' problems. Just recently, he passed the professional engineering exam and modestly related his few difficulties to his students. Coupled with this understanding and modesty is his friendliness and willingness to help, and those of us who have had the opportunity to be inspired by him have been fortunate indeed.

It is in recognition of his achievements and contributions to the profession and in appreciation for his services to the school and its students that this ANNUAL CRUISE is dedicated to Professor William A. Davies.

Bob Cramer

## MAC'S MESSAGE

This has been a year of challenge to the forest industries. Fewer housing starts and fewer major construction jobs have decreased lumber markets and increased the competition. Wood processing companies with initiative, imagination, resources, and gumption are still doing business, while others lacking these qualities have failed.

Same with foresters. Rapidly mounting enrollments are increasing the number of competitors for forestry jobs. At the same time the rate of increase in forestry jobs has slowed down. Result: in some industrial areas there are enough men to cover all the jobs, for the first time in ten years. There will be still more men available in the near future because a number of forestry schools have been started in the South and East this year.

The previously existing forestry schools were deemed adequate to supply the needs of employers for some time to come. Hence the addition of more students in more schools could result in an oversupply of foresters in some areas, at least temporarily. You know where those excess graduates will turn for jobs—right here to the heart of the nation's biggest woodpile, biggest forest industry, and biggest national forest region. The Northwest is the mecca for foresters from all over the nation, particularly from states where local schools oversupply local needs for foresters.

The moral for Oregon State foresters is obvious. They will need to compete not only among themselves but against all comers for all other regions. A forester who has the backbone to cut his old home ties and travel two thousand miles to a new region looking for work, very often is a top man with top ability to do a good job when he gets there. To meet this kind of capable competition it will be necessary for Fernhoppers to display more initiative, imagination, resources, and gumption than has been required for the last decade.

The staff here intends that no man shall leave this school ill-prepared. We will provide him opportunity to make himself strongly competitive against all comers, and to contribute effectively to forestry in the process. A return to more normal employment conditions does not dismay us in the least. We welcome any adversity as a spur to better achievement; if things become tough, Oregon State foresters will just become tougher.

W.F. "Mac" McCulloch

**WALTER F. McCULLOCH, Dean**

Mac's experience in forestry started in 1925 when he received his B.A. from the U. British Columbia. He spent the next nine years with the B.C.F.S. and private industry (including the Erie Railway). In 1936, after two years of graduate work and instructing at Syracuse, he received his M.S. and became forestry research director at Mich. State. In 1937, Mac began teaching forest management at O.S.C., and in 1942 he became the Asst. St. For. of Oregon. In 1945 Mac began graduate work at U. Ore. and received his Ed. D. from there in 1947. He became the Dean of the School of Forestry in 1955.

**WILLIAM P. WHEELER**  
Assistant Prof. of Forest Management

In 1948, Bill was graduated from U. of Minn. with a B.S., and a year later he received his M.F. from that school. Bill was a teaching assistant and research asst. during his school days. He joined the School of Forestry in 1949, and began teaching forest management and engineering courses. However in 1955, Bill was promoted to Director of Personnel and his teaching has been limited to forest administration and seminar.

**W. I. WEST**  
Professor of Forest Products

Bill, a department head, was graduated from the U. of Wash. with a B.S.F. in 1939 and a M.F. two years later. He has been a research associate and teaching assistant for the U. of Wash. and a research assistant for the W.C.-L.A. Bill has been at O.S.C. since 1946 and instructs in manufacturing problems, merchandising, the lumber plant, wood preservation, and seminars.

**WILLIAM A. DAVIES**  
Professor of Forest Engineering

Woody, a department head, was graduated from Univ. of Wash. in 1938 with a B.S.F. and with a M.F. eight years later. He worked several years in logging, surveying, timber sales, and fire control before and during his school days. Upon being graduated in 1938 he worked for private industry for six years until he joined the faculty here at O.S.C. in 1946. He is an instructor in senior and graduate engineering courses.

**J. RICHARD DILWORTH**  
Professor of Forest Management

Dick, the head of the FM department, received his B.S. from Iowa S.C. in 1937. Two yrs. later with a M.S. from that school, Dick migrated to La. S. Univ. where he taught eight yrs. In 1946 Dick accepted a position with the School of Forestry and he has been teaching Fernhoppers ever since. Dick took time out in 1956 to complete his Ph. D. at the Univ. of Wash. Since his return he has been teaching photogrammetry and mensuration.

**GEORGE H. BARNES**  
**Professor of Forest Management**

George was graduated with a B.S. from U. of Wash. in 1924. He moved to U. of Calif. and received his M.S. there three years later. George came to O.S.C. in 1943. He taught forest management here until he traveled to Duke University where he received his Ph. D. in 1946. He is now the Ass't Director of the Forest Research Division Agricultural Experiment Station.

**ALEX J. JAENICKE**  
**Forest Management Lecturer**

Alex came to O.S.C. in 1956. His experience in forestry dates back to 1912 when he received his B.S.F. for Penn. State Univ. He has spent 45 yrs. working in western forest regions with the USFS. Alex's work was mainly forest management and production, but he spent considerable time training F.S. employees in these fields. Since his arrival at O.S.C., Alex has been teaching those same two fields.

**CHARLES W. DANE**  
**Assistant to the Dean**

In 1952 Chuck graduated with a B.S. degree from O.S.C. The following three years were spent with the Roseburg Lumber Co. where he worked as a logging engineer. In Sept., 1955 Chuck became a faculty member of our School of Forestry and has since been teaching such courses as forest engineering, logging road design, logging methods, and industrial forestry.

**WILLIAM K. FERRELL**  
**Associate Professor of Forest Management**

Bill has been with the school of Forestry since 1956. He received his B.S.F. from Univ. of Mich. in 1941 and his M.F. from Duke Univ. in 1946. From 1948 to 1956, Bill did forest research at the Univ. of I., but in 1949 he returned to Duke to receive his Ph. D. that same year. Bill resumed his work at the Univ. of I. and in 1953 he began to teach. Since his arrival here, Bill has taught ecology, regeneration, and mensuration.

**DWIGHT S. JEFFERS**  
**Special Lectures**

Dwight completed his A.B. at Ill. Wesleyan, and his M.F. and Ph. D. at Yale University. Dwight worked for the USFS for 11 years and was supervisor of the Arapaho and Uncompaghre Nat'l Forest. He taught at Iowa State College and U. of Wash., and he was Dean of the U. of Idaho School of Forestry. He has been at O.S.C. since winter term of 1958 and instructs policy and economics, and general forestry

**JAMES T. KRYGIER**  
Assistant Professor of  
Forest Management

After the army Jim got his B.S. in Forestry from Utah State University in 1952. He received his M.S. in Forestry in 1955 from Utah State too. Jim has taught at OSC since 1954. He teaches Tree Ident., Watershed Management, and Forest Protection.

**MILFORD D. MCKIMMY**

Mac received his B.S. from Mich S. in 1949. Two years later he received his M.S. here at O.S.C. and joined the faculty in 1953. The next year he completed his Ph. D. at N.Y.S. College of Forestry. Mac has done a considerable amount of research work for federal, state, and private industry. Timber mechanics, wood properties, wood utilization, wood seasoning and ply and laminated products are the courses Mac instructs.

**HARRY I. NETTLETON**  
Forester of McDonald Forest

After being graduated in 1921 from O.S.C., Net taught Fernhoppers for two years. He then moved to U. of Idaho where he received his M.S. in 1928 and taught for two years. Net spent six years with the U.S.I.S., and returned to teach at O.S.C. in 1936. In 1942 Net began working for the BLM; however he again returned to teaching at O.S.C. in 1947. A year later he accepted his present position as Forester of McDonald Forest.

**JOHN E. O'LEARY**  
Associate Professor of  
Forest Engineering

John, a graduate of Univ. of Mich., received his B.S.F. in 1942. After four yrs. in the Navy and one yr. in private industry he received a M.F. from O.S.C. John spent two additional yrs in private industry and then began teaching at the School of Forestry in 1949. His courses include logging methods, logging roads, forest engineering and senior seminar.

**HENRY R. PATTERSON**  
Prof. Emeritus of Forest  
Engineering

Pat is considered to have had more influence on the logging in Oregon than any other single man. Pat was graduated with a B.S. in C.E. from Univ. of Ore. in 1909. After spending eleven years as a logging engineer, he accepted a position with the School of Forestry. Pat taught forest engineering until 1951 when he retired from his position as Head of Engineering Depart. and acquired his present status.

**LOUIS W. POWELL**  
Instructor in Forest  
Management

Louis received his B.S.F. in 1950 from O.S.C., and his M.F. from Duke Univ. the following year. His two years with O.S.B.F. was followed by two years with Mont. S. Univ. In 1955, Louie began to work on his Ph. D. in Forest Ecology at the Univ. of Wash. That fall Louie became a School of Forestry faculty member and has been teaching mensuration, aerial photo, dendrology, tree ident., and general forestry.

**WARREN R. RANDALL**  
**Assistant Professor of**  
**Forest Management**

Casey received his B.S.F. degree from the Univ. of Idaho in 1943 and his M.S.F. in 1947. During his undergraduate and graduate days, Casey worked as a laboratory assistant for Univ. of Idaho. He accepted a position with our School of Forestry faculty in 1947. Among the courses taught by Casey are timber growth, recreation, general forestry, and tree identification.

**DAN D. ROBINSON**  
**Professor of Forest**  
**Management**

Dan received his B.S.F. from O.S.C. in 1940. He then moved to Syracuse Univ. where he received his M.F. two yrs. later. Dan worked as a forest warden and farm forester until 1944 when he became the extension forester for O.S.C. In 1946 Dan joined the School of Forestry faculty and he now teaches forest orientation, forest practices, fire control, and farm forestry.

**ANTONE C. VAN VLIET**  
**Instructor in Forest Products**

Tony graduated from O.S.C. in 1952 with a B.S. in wood technology. After two years in the Army, he returned to Oregon State to begin teaching. He has spent several seasons working for the USFS, O.S.B.F., O.F.P.L., and private industry. Since his return in 1955, he has been instructing in courses in wood technology, wood utilization wood ident., wood anatomy and micro-technique, and photomicrography.

**ROBERT L. WILSON**  
**Assistant Professor of**  
**Forest Engineering**

Bob was graduated from Univ. of Iowa with a B.A. in 1942. After three yrs. in the Army, he completed his M.F. at Colo. A&M College. Bob taught forestry at Kan. S. C. for two and a half years. He accepted a position with the O.S.C. in 1952, and has been an instructor in forest engineering subjects.

### Give Me This

When ere I walk along a wind blown hill  
Or down a wooded valley by a spring,  
I find in this a peace of mind that will  
Do more for me than all the wealth of kings.

To stand, transfixed in awe, and watch a cloud  
So high, so white, against a summer sky  
of deepest, clearest azure blue; a shroud  
of mist enfolding mountain peaks so high.

To pause and rest a while at dusk, to see  
A sight that words so fine cannot describe,  
A sunset soft of hue and tone so free,  
A spectacle forever in mind inscribed.

Give me these things of which I tell, no more;  
Then I will all the gold of men ignore.

Ed Barton, '58

### THE FERNHOPPERS

They come, alike, from near and far,  
A care-free, happy crew,  
And meet at the door that has no bar,  
A man that is good and true.

They feel the spirit and know the worth  
Of days that are wondrous full,  
And are charged by grace of a new-found birth  
To a life that will always pull.

They tramp the hills and walk the halls,  
As others have done before,  
And know the joys of a work that calls,  
Far back from a distant lore.

They sit, alike, in hopes and dreams,  
Beside the roaring fire,  
And feel the warmth from out its beams  
Of a world that will never tire.

—N.R.H., '29

### A FERNHOPPER TOAST

Now here's a toast to Oregon State—  
 The school where the Fernhoppers grow;  
 Where you study mapping, finance, and rate,  
 And cruise in the rain and snow.  
 But thank your luck and the gods of fate,  
 Lest your grades be too damn low!

—Vondis Miller, '30

*The Annual Cruise  
Proudly Presents*

# OLIVER V. MATHEWS

All foresters know some things about some trees; some foresters know all things about some trees; but Oliver Matthews, a most remarkable man, intends to know all there is to know about all the trees that grow in Oregon.

For many years Oliver has studied trees with an extraordinary singleness of purpose. He is unselfishly dedicated to the pursuit of knowledge about trees. Come hail or snow, hell or high water, rain cats and dogs or sun fair and fine, in all seasons and under all conditions Oliver can be found scrounging the woods of Oregon with ax, camera, and notebook in hand. The notebook is to record precisely the place, date and local conditions under which the tree was found; the camera, of course, to picture it; and the ax to clear an acre or two of forest if need be, so that the favored tree will stand alone in all its glory. For the picture must be nothing but the very best; merely excellent photos are not good enough for Oliver. He spent one memorable summer hunting for top quality pictures of just two trees, one a hackberry in a panoramic view of the Oregon-Washington-Idaho 3 State corner in the bottom of the Snake River Canyon; and the other a group of Sitka Spruce at the extreme axis of the state, near the Oregon-California state line in southern Curry county. A whole year and some scores of pictures later, he had just two photos which satisfied him. This is an illustration of Matthews the perfectionist.

His great interest and enthusiasm are both contagious, and he has stimulated an active interest in trees among old and young alike. In this relentless search for the truth, he put 225,000 miles on one

Oliver, on his 65th birthday, renews acquaintance with this Oregon Big-Leaf Maple tree which he played in as a child. Tree is located at the west entrance of Waller Hall on the Willamette Campus at Salem, Oregon.

motor in a second-hand Model A Ford, added 23,000 miles on a second till the speedometer broke, and then tallied many thousand miles more until the body gave out. At an age when others are content with a quiet, sedentary way of life he is as eager and as busily vigorous as ever. Miles and misery mean nothing if he can raise the scent of an unusual tree, a newly reported "biggest" tree, or an old tree in a new locale. Such ruthless attention to business has made him the most knowledgeable tree man in the country.

Fortunately for foresters he is willing to share this information, and he's eager to do so. Through the years he has built up a fine set of detailed notes, maps, and scrapbooks, all available to those who are concerned with forest trees.

When the biggest ponderosa pine was discovered on the banks of the Deschutes it was Oliver single-handed who hacked out a trail through the tough lodgepole thicket so that others could get to it easily. When the oracle oak was rumored on lower Grave Creek it was Oliver who pushed to the limit his worn out overheated Model A Ford motor determined not to give up the search till he found the tree. He did. It was Oliver, who on a subsequent trip to photograph that tree, slept in his car in weather so cold that his false teeth froze to the bedding. Through his untiring attention to facts he has added greatly to our forestry knowledge. He has run down and photographed the Siskiyou (Baker) cypress in the high Siskiyou, limber pine in the Wallawas, Alaska yellow cedar in the Blue Mountains, and the Narrowleaf Cottonwood in the

Pueblo Mountains. It is fitting that his research is acknowledged in the scientific name of the *Siskiyou Cypress*—*Cupressus bakeri* Jeps. subsp. *Matthewsii* Wolf.

The School of Forestry is indebted to Oliver for his famous tree lectures, generously illustrated with his equally famous pictures. In addition, he has donated several valuable collections of hard-earned wood samples, and has helped to classify many specimens. He is the largest single contributor to the School's wood collection. His gift exceeds 500 samples, the majority indigenous to Oregon. Many large panels were received from Oliver and now they are a part of the wainscoat on the third floor of the Forestry building. His interest as a wood collector has taken him to the far corners of Oregon, Washington, and northern California, representing many thousands of miles of travel. He has given books to the School library, and many hard-earned herbarium specimens both to the School and the College. But far more than these generous gifts, the School is grateful to Oliver Matthews for a classical example of conscientious workmanship. Here is a man who has brought to perfection the art of doing a job so well that he is acknowledged to lead all others in this respect. He will never quit no matter how difficult the road, will never be content until he knows all there is to know about trees. For this rare example of scholarship, leadership, and spirit, Fernhoppers are obligated to Oliver Matthews, and the *Annual Cruise* here records their obligation and their admiration.

## **FERNHOPPER SPIRIT**

Last spring term marked the liveliest display of spirit in the Forestry School that can be recalled for many years. One of the contributing factors was the humorous and scenic "Wednesday-noon meeting" held in the Food Technology Auditorium. Students, staff, and the OSC dancing rally girls combined their talents to bring forth a program that attracted better than 90% of the Forestry School enrollment. The program included a skit by the forest products department, a student-staff satire on Dean Mac, "The Faculty Quartet," and the "Banana Dance" performed by the rally girls!! When we learned that this was the first time the rally girls had ever performed for anything other than an official OSC student body function, we felt especially honored! The purpose of this get-together was to stimulate school spirit and promote closer relations between students and faculty.

Following a very enthusiastic and colorful club election campaign came the real feat of the term: our challenge to the OSC varsity football team to a tug-of-war on the Memorial Union Quad. On the appointed date hundreds of spectators crowded around a 300 foot hauser rope and nozzle end of a large fire hose, which was aimed at the halfway mark of the rope. On either end of the rope stood eleven foresters and eleven footballers. A couple of minutes after the "tug" got underway, the foresters were threatened with being dampened, and so with this in mind and a bit of strong determination, they reversed the "tug" and slowly but surely pulled the footballers through the water in front of an astonished crowd. For this victory a trophy was presented to the foresters—a wooden laminated toilet seat with a plaque bearing the following inscription: "People don't realize how closely they are associated with wood. The economy of Oregon is seated on forest products."

The burley foresters set their boots, heave, and . . .

. . . pull OSC's Rose Bowl football team through the water.

*Spring*

## SPRING THAW

A certain morning in May dawned bright and clear, and warm enough that thoughts of swimming and log burling were foremost in everyone's mind. This was the day of the Spring Thaw for 1957.

A new concept was initiated with this Spring Thaw, as the home economics students (all girls!) were to join in the fun, and they certainly did! The girls, not satisfied with the egg throwing contest (which left many in need of a bath) did very well in other contests too, such as match splitting. The Fernhoppers drew the line at log burling however, as it was time for the main contests to begin.

The rest of the day the Fernhoppers demonstrated their skill at single and double bucking, chopping, and boom waltzing. The dripping wet "boom-waltzers" appropriated canoes from certain moonstruck foresters and their girls for a few rounds of canoe jousting. The cross-country race had to be called off—something about the large number of girls in the area making it too difficult to finish the course.

After the contests, swimming and canoeing at Cronemiller Lake, the group moved to the Forestry Club Cabin where awards were presented to the contest winners, and Sharon Beauvois, Forest Fraulein I, was appropriately crowned with a yellow hard hat. Following the coronation, a picnic style meal was served that was fit for a king and twice as filling.

The Fernhoppers and their dates brought the Spring Thaw to a close with the traditional dance in the Club Cabin that night. It's been said that both the Fernhoppers and Home Ec'ers are eagerly awaiting May of 1958, when they'll have a chance to do it all again.

# A. W. F. C.

On May 10, 1957, sixteen forceful fernhoppers set sail for Seattle and the annual AWFC Conclave where members of western forestry schools were guests of the amiable aggregation of foresters at the University of Washington.

After initial administrative details were attended to, the conclave moved into full swing with the presentation of club progress reports. A brief tour of the Weyerhaeuser mill in Everett followed. The first evening's activities were highlighted by a banquet at which Dr. Donald H. Clark presented a stimulating talk.

The succeeding day's agenda included a visit to Weyerhaeuser's Snoqualmie Tree Farm where the group viewed a high-lead show and witnessed a tree-topping demonstration.

In the afternoon numerous committees discussed conservation, constitutions, club activities, club duties, and contest rules.

At the final business meeting committee reports were summarized and presented to the entire group. Also at this time the University of California was chosen host school for the 1958 conclave.

With the business portion of the conclave completed and the grueling contests due the next day, the foresters decided to digress from the heavy responsibility of duty and indulge in an evening of diversified social activities. The group satiated its desire for celebration by tripping the light fantastic with beautiful maidens and sipping from the tapped keg with enthusiastic colleagues.

The conclave's concluding day featured many keen and colorful contests among the slightly bleary-eyed competitors. When the chips quit flying, Oregon State College was announced king. The fernhoppers' glory was short lived, however, as an error in point determination was found and the University of Washington was announced winner.

**Ken Evans rips through the log while George Cook oils the saw, and Kelly Sigler holds it solid.**

Thus the 1957 Conclave was brought to a close. It was felt by all that the interchange of ideas among the students of the profession made the meeting extremely worthwhile.

Rather than indulge in circumlocutions and say that the fernhoppers upheld their impeccable record of abstaining from the cup that cheers but does not inebriate, it would be more appropriate to say that when it comes to quaffing brew, fernhoppers are still the undisputed champions.

The sixteen delegates making the trek north were: James Cavillan, Ken Evans, James Reed, Dick Tutt, Don Koten, George Cook, Edgar Barton, Monroe Kimsey, Kelly Sigler, Ray Franks, Charles Hardin, Arlie Holm, John Poppino, Dick Pryor, Bill Sager, Jerry Holdgrafer.

**Kelly Sigler whales away for a past time.**

**Cook, Evans and Barton adjust the carburetor while Pryor measures the next cut.**

# FALL ACTIVITIES

Our illustrious red tie as it hung in all its glory from the front of the M.U.

The tug-of-war between the rooks and sophomores; the rooks won.

What type of dance is this?

Cloudy-wet weather greeted the new Fernhoppers at "O" Day this year. The new men assembled at the Forestry Building and proceeded to the Forestry Club Cabin via the traditional route.

The eager Fernhoppers, young and old, tried their skills at log burling, boom-log racing, log bucking, chopping and match splitting as soon as they arrived at Cronemiller Lake. A tug-of-war between the rooks-sophomores and juniors-seniors was next on the agenda. All were interested in the chain saw demonstration and even the "old timers" learned something new.

"O" Day was highlighted again this year by having as a guest Stan Lyon, 1955 World Champion High Climber and All-Around Logger and three-time All-American Topping Champion. He is an honorary lifetime member of the OSC Forestry Club. Stan gave a talk on woods safety and then finished with a tree-topping demonstration.

The day was closed by a short club meeting, introductions of club officers and a talk by Clay Peters. Hot dogs and beans were had for supper. Sorry to say, they were not Pat's famous "bean-hole" beans.

The Fernhoppers red-tie hanging was a climax to the football season this year. Two red ties forty feet long and one fifteen feet long were suspended from Commerce, Memorial Union and Engineering Buildings. The ties, which said, "Beat Oregon", were made by the reliable Femmes. The Oregon Journal summed up these "doings" nicely when it said, "The austere Memorial Union Building, never before in history decorated under any circumstances, has a 40-foot banner streaming from its rooftop."

Fall activities were brought to a close by the Foresters-Home Economics Dance. A good time was had by all that late December evening. The theme of the dance was "Far West 1800" and centered around the coming holiday and the Christmas tree. The hungry dancers were quite happy with the refreshments which consisted of cider and donuts.

Tom Appel

The "Trends" trio tune up to entertain the foresters.

## FERNHOPPERS BANQUET

February 22 was a red-letter day for the foresters of Oregon State College. From as far as Idaho, Washington and Northern California, "Fernhoppers" and friends journeyed to Corvallis to participate in a full day of activities.

The "Fernhoppers," along with seeing old friends and making new ones, took tours through McDonald Forest and the Forestry Club Cabin, the new Oregon Forest Research Center, and the Oregon Forest Insectory. Coffee, doughnuts, a lot of good conversation, and a large crowd were to be found in the Forestry Building throughout the day.

The movie, "Your Career in Forestry," which was prepared at the School of Forestry by the Weyerhaeuser Timber Company for the use in vocational guidance, was shown three times during the day. In the afternoon, the Forestry Alumni Association held its annual meeting and elected Ralph DeMoisy president for the coming year. They also decided that the job of informing high school faculties and students in the area about careers in forestry would be one of their chief projects.

At 5:30 p.m. the 26th annual Fernhopper's Banquet was held in the Memorial Union Ballroom. About 500 foresters consumed a hearty meal of fried chicken, and enjoyed group singing under the more than able direction of George Schroeder and Walt Gustafson. Ray Schaaf, general chairman of the event, welcomed the group and introduced Dean McCulloch. "Mac" introduced several prominent guests and the feature speaker of the evening, DeWitt Nelson, Director of the Department of Natural Resources for the State of California. Mr. Nelson has long been prominent in forestry and is also a past president of the Society of American Foresters. His topic was, "No Tree Makes A Forest." It was concerned with the necessity for foresters cooperating with each other and with other professions and groups, and for accepting a high degree of social responsibility in practicing their profession whether they be publicly, privately, or self-employed. (Mr. Nelson's speech is presented on Pages 35-37).

Dewitt Nelson, our featured speaker, drives home a point.

The evening was brought to a close with a few words of thanks and commendation from "Mac," and the singing of "God Bless America" by the group.

However, if one visited the clubs and other establishments in the area later in the evening, it was quite apparent that a large number of Fernhoppers were still holding informal meetings and get-togethers until the wee hours of the morning.

John O. Tollefson

The fried chicken was good!

# NO TREE MAKES A FOREST

Presented by DeWitt Nelson, Director  
California Department of Natural Resources  
at the 1958 Fernhopper Banquet

Tonight we gather here as "Fernhoppers"—foresters who have a common background of education from this uncommon School of Forestry at Oregon State College. What makes this school great is not its excellent physical plant but the men who have devoted their lives to teaching here and to the professionally trained foresters who have graduated and gone into the forests and industrial plants and applied the principles and ideals they learned here. It isn't so much the technical competence that they gained here but the training in its application that has made it possible for them to use that knowledge in meeting the practical problems in the field. At this annual meeting of the alumni you have the opportunity of again bringing into focus the influence which your school and its professors have had on your lives. Here on this campus of outstanding beauty and inspiration you have the privilege of renewing friendships, of sharpening your professional wits and of learning what others are doing and thinking.

The romance of forestry is one of the magnets that has drawn men to it throughout the years. I know of no young forester who did not dream of working in the "Big Woods," of planting trees, or of being responsible for a small forested empire. It has been said, "What would man do without his tomorrow? The past, though pleasant to remember, is over and done with. The present is always tugging us. But tomorrow, that is the dreamer's paradise. Everything is possible with tomorrow; no dream too foolish, no goal too high." I am sure that this quotation bespeaks that which has been the keystone of education here at Oregon State College, and particularly in its School of Forestry. It has turned out men with dreams, and the knowledge, the desire and the courage to make those dreams come true.

Forestry is not an exact science. There is no formula that will tell us the stresses and strains that a young forest must endure to produce a given quantity of a specified quality of wood one hundred years hence. However, through research and experience we are rapidly gaining knowledge which strengthens our ability to prescribe methods and techniques for long term wood production that justifies millions of dollars in plant investment.

As I traveled through the forests of the Siskiyou and Cascade Mountain ranges yesterday I realized anew that "no tree makes a forest." The combination of soil, water, minerals, grass, brush and trees living together, competing for the same food and sunlight and yet bracing against each other to stand against the wind makes a living and dynamic community of nature. Trees are very much like people. They are subject to infections; they fight for a place in the sun;

they stand together when the storm lashes; they are sensitive to environment influences and they are responsive to good treatment by their managers.

As foresters, we are fortunate that trees are responsive to management. Even though our profession is young we have learned much during its short existence. But no one knows better than you the areas in which our knowledge is lacking. However, I often wonder why it takes us so long to put new knowledge into practice once that knowledge is available. Is it our natural resistance to change or is there as much "red tape" in our mental processes as there is in our operational procedures? It might be worthwhile examining the problem of how to extend and apply new knowledge more quickly.

It is unfortunate that it takes time to change habits and traditions that have developed over the centuries, but as foresters, we have a responsibility to accomplish that change. As our population continues to expand the demand for forest products will increase. Upon our ability to balance growth with harvest will determine whether following generations will have either plenty or scarcity—theirs will be the right to either commend or condemn our foresight and techniques. This is literally true and cannot be over emphasized—the future of America depends upon our vigilance in managing, developing and utilizing our basic resources of soil, water, forests, forage, and minerals. Herein lie the forester's great responsibilities and his great opportunities. This is idealistic—it is also realistic. We must have both idealism and realism. I have yet to see a forester who does not have a bit of idealism in his make-up. It is an essential ingredient for one who is working with nature on long-term production programs.

As no tree makes a forest, so no forester makes a profession. Many foresters working together with the complex problems of forest and land-use are building our important profession in this country. It took a good many years for us to realize that we must develop our own silvicultural methods and to discard many of the European methods which had been evolved over centuries of intensive management. Such methods did not fit our forests or the problems of converting an old-growth stand to a second-growth one.

Here in the west we have built a great civilization and a dynamic economy with a one hundred year "crash program" of resource use. Obviously, practices which were acceptable when this was a land of abundant resources and small population cannot now be permitted. Today industry is viewing a much wider spectrum of relationships involving not only current profits, customers and stockholders but employees,

community interests and society as a whole. In fact, business and industry are accepting a new dimension—that of recognizing the long-range social responsibilities so essential to the future.

To meet the challenge of this new dimension, public agencies and industry are looking toward tomorrow with improved forest practices, with full-blown land and timber management plans, with consolidation of ownership holdings, with integrated manufacturing plants for full utilization of raw materials and putting to use the knowledge of many sciences.

No profession is sufficient unto itself. We cannot survive, let alone progress, in our own watertight compartments. We must use the skills and knowledge of the entomologist, the pathologist, the soils scientist, the zoologist, the geneticist, the economist, the engineer and others. In order to assure success each science and each professional group must contribute its knowledge to the other in order that we may integrate methods and techniques in the management of our resources.

We speak glibly about integrated mills and production plants for full utilization of raw material. Knowledge and skills are our raw materials. How often do we seriously and consciously plan the integration of all the basic sciences into our land and resources management programs? How often do we permit personal interest or a prejudice to dictate our policies or the direction of management. Think it over—are we guilty of such non-professionalism?

Many good forest practices have been developed by extemporaneous or trial and error methods. Such procedure is frequently necessary but is often costly in both time and timber. Gradually research and experience are enlarging our background for application in the field. At the same time the development of this new knowledge and these techniques exposes great areas of ignorance into which we must grope. One basic principle we know, but one which is not yet sufficiently practiced—our great forest areas can be better managed and improved, or poorly managed and consequently impaired.

Forestry is now going through its greatest period of opportunity. Forestry has come of age. It is truly recognized as a profession and is accepted as such by the public, by the land owners and by the forest industries. The future of this mature profession cannot be left to chance. Our schools and practicing foresters have an obligation and a responsibility to exert real leadership—leadership that is willing to compromise issues but not principles; leadership which recognizes that, in our form of government, progress is made through a process of evolution and not revolution.

Here is a task that we can achieve only through understanding and teamwork between people, the public foresters and the private foresters striving for a common goal. We must stimulate progress and yet be patient when it seems painfully slow. We have seen this understanding and teamwork develop in recent years. It is, in effect, our “bracing against the wind”. To detect it one has only to attend such meetings as the Western Forestry and Conservation Association, the Sierra-Cascade Logging Conference, to examine cooperative projects in the fields of protection from insects, disease and fire, and in research programs in

which many are working together.

Today's concept is that of more effectively blending the theoretical with the practical; the fusion of the wood using industries with the science of land use and timber production. More and more the laws of economics are playing a leading role in sound forestry. More and more good forestry is proving economically profitable.

One of the interesting things about forestry is that it encompasses such a broad field. During recent years as Director of the California Department of Natural Resources I have had an unusual opportunity to become increasingly aware of the relationship between forests, soils, water, forage, minerals, wildlife, water pollution control, recreational opportunities, and above all—people.

Each of these resources (other than people) is separately administered as an independent function. Although they are separated administratively, this does not make it possible to keep them apart and to treat them independently in the field. If it were not for the people, their needs and demands, there would be no problems. But because people are people we find that they want recreation of every kind wherever they can find it, regardless of land ownership or use; the miner wants the right to file a claim on public lands; the timber owner is concerned with who hunts and fishes on his land; the pure conservationist bemoans the ravaged appearance of harvested areas. There is urgent need to minimize soil erosion from all forms of land use to protect streams, reservoirs and our future production capacity. The competition for wilderness areas versus multiple resource use, the use of fire as a tool in land management as opposed to fire exclusion and the question of the removal of lands from the tax rolls for public use purposes are constantly before us. These are areas of conflict and competition that require closer correlation in resource planning and resource management.

Many of these conflicts may be summarized in a brief phrase—public interest versus private interest. But these two categories are far from being crystal clear. Have you ever tried to define “public interest” or “private interest”? The definition will depend largely upon your point of view and will soon become just a matter of personal or group opinion. However, when such conflicts arise someone or some group must make a decision—but such decisions rarely meet with unanimous approval. Problems such as these confronted our early pioneers in forestry when, in 1907, Gifford Pinchot, Teddy Roosevelt and others applied a new meaning to a word already in the dictionary—the word “conservation”.

It was this complexity of problems that confronted the pioneers in the field of natural resources. As Mr. Pinchot points out in his book “Breaking New Ground”—“Many problems fuse into one great policy, just as many states fuse into one great Union. When the use of all the natural resources for the general good is seen to be a common policy with a common purpose, the chance for the wise use of each of them becomes infinitely greater than it had ever been before”.

Fifty years ago there were few people thinking about conservation through wise use. During these past fifty years we have come a long way in joining

hands in "a common policy with a common purpose". People, industry and public agencies are working together ever more closely to assure a continuing supply of natural resources. And well that we should for as Pinchot again points out:

"What do you eat, morning, noon, and night?

Natural resources, transformed and processed for your use. What do you wear, day in and day out—your coat, your hat, your shoes, your watch, the penny in your pocket, the filling in your tooth? Natural resources changed and adapted to your necessity.

"What do you work with, no matter what your work may be? What are the desk you sit at, the book you read, the shovel you dig with, the machine you operate, the car you drive, and the light you see by when the sunlight fails? Natural resources in one form or another.

"What do you live in and work in, but in natural resources made into dwellings and shops and offices? Wood, iron, rock, clay, sand, in the living you earn, the medicine you take, the movie you watch, but things derived from nature?

"What are railroads and good roads, ocean liners and birch canoes, cities and summer camps, but natural resources in other shapes?

"What does agriculture produce? Natural resources. What does industry manufacture? What does commerce deal in? What is science concerned with. Natural resources.

"What is your own body but natural resources constantly renewed—your body, which would cease to be yours to command if the natural resources which keep it in health were cut off for so short a time as 1 or 2 per cent of a single year?

"There are just two things on this material earth—people and natural resources.

"From all of which I hope you have gathered, if you did not realize it before, that a constant and sufficient supply of natural resources is the basic human problem".

Therein is emphasized the need for integrating our knowledge, our professions and our sciences for the purpose of attaining a common goal for an abundant supply of resources for safe and comfortable living. Again we see that no tree makes a forest, no forester makes a profession and no profession stands alone, but working together they can achieve that which is good and essential for a full life. Many years ago President Wheeler of the University of California told a graduating class, "Our future concerns the use we make of our training here—the result will be what we make it. Destiny is a great word, but so far as each of you is concerned, it is a home-made article".

There is truth in that statement but I believe that many things combine to shape that destiny. For you, many of those component parts were assembled here at Oregon State under the stimulating influence of dedicated professors. It is well that you remember those professors with whom you have had such valuable association for they left an indelible impression upon you. They taught you more than that found

between the covers of a book. Among them were the strict disciplinarians, the idealists, and the realists. They all went beyond the call of duty in trying to teach you the theories, principles and facts of forestry, and more than that, the common-sense application of that knowledge in the field. Theirs probably was a hard task—one that has required the utmost in faith, hope and charity.

You have had your Dean G. W. Peavy, Dean Paul Dunn and now Dean W. F. McCulloch. You have another whom I am thrilled to see here tonight—a man to whom I owe more than my words can express, a man who has left his mark on graduates from four different schools of forestry—Professor (Dean Emeritus) Dwight S. Jeffers.

To all of these men, we owe a great debt of gratitude—a debt that can be paid only by passing on to others the same type of devotion, leadership and inspiration that they gave us.

In closing I borrow one more thought from Gifford Pinchot: "The conservation of our natural resources is the key to the future. It is the key to the safety and prosperity of the American people, and all the people of the world, for all time to come".

This is our challenge—can we meet it, and, if so, how can we meet it?

No tree is alone in the forest. No man is alone on the land. We can meet this challenge by the blending of our knowledge and skills, by mutual trust and understanding and by our faith in the future.

# FORESTRY CLUB

Forestry Club Executive Council from l to r: Pettey, Bye, Pryor, Jones, Aulerich, Peters, Schenck, Martin, MacCloskey, Adolf, B. Krueger, and Mays.

It is with a feeling of great satisfaction and accomplishment that we look back over this past Forestry club year. Our O-day, Fernhopper Banquet, and Spring Thaw, which form the backbone of each club year, were supplemented by a number of colorful and unprecedented activities—things like our tug-of-war victory with the OSC varsity football team, and the hanging of the 40-foot “Beat Oregon” red ties around campus prior to the OSC-Oregon football game.

This year saw the installation of two large picture boards in the forestry building's main hall bearing the names and pictures of the students. Also the Student Advisors Committee was successfully continued this year after being initiated last year. A bolster to the club's treasury this year was the planting contract and the Christmas tree sale during Christmas vacation which brought in nearly \$320.00.

Our club meeting programs this year were varied and interesting and are worthy of mention. Don Chapman, who is working on the Alsea River Basin Study, gave an illustrated talk on the effects of logging on fisheries resources. At the second meeting, Hank DeBruin, USFS, gave a highly inspirational talk combined with slides on the aspects of opportunity, success, and happiness. The importance of research to forest products was related in an illustrated talk by Jack Grantham of the Oregon Forest Research Center. Don Peters, USFS, touched on the recreational use of National Forests in the winter. His slides covered many of the popular winter sport areas of the Pacific Northwest. Our next program was presented by Art Smyth, Dean Higinbotham, and Herm Sommers of Weyerhaeuser Timber Company who brought us

a well-co-ordinated program outlining their operations in the Coos Bay area. Following this meeting Dean McCulloch (Mac) entertained the club with his humor and some exceptional slides he took of the Northeast Canadian country.

The many unique accomplishments we've made this year would of course not have been achieved without the help of the many students who participated. We would personally like to extend a sincere thanks to all who pitched in and helped. It is a fine expression of Fernhopper spirit.

Clay Peters

# SPORTS

Terrific power and running ability was shown by this hard-hitting Fernhopper football team. From l to r, the line: Rider, Tollefson, Krueger, Sigler, Newton, McDowall; the backfield: Keene, Guinan, Schenck, and Roth.

Our basketball team showed a lot of talent in winning 5 out of 7 games and taking second in the Independent League. From l to r, standing: Olsen, Krueger, McDowall, Cook, Conan, Tourtellot; kneeling: Sigler, Notenboom, Rider, Concini, and Paproke.

## THE LOGGING ENGINEER

He plays with rigging and tackle,  
And works with "donkey" and "gun;"  
He thinks of trees in log lengths,  
And imagines he's having fun.

He stalks out in the morning,  
As Paul Bunyan did of old,  
And bosses the business proper  
With bellowed commands, so bold.

He fires his fragrant corn cob,  
And belches smoke and steam.  
For all his many drawbacks,  
He's a ten-horse, rampin' team!

We forget his trousers dirty,  
We're blind to his funny gear.  
When we see him roll the timber—  
We praise the Logging Engineer!

—N.R.H., '29

# HI-LEAD

Copy editor, John Robatcek.

Editor, Al Petty.

Production editor  
Chuck Johnstone.

The success of this years Hi-Lead may be attributed directly to the untiring, sometimes heroic, efforts of the entire Hi-Lead staff. The writers, too numerous to mention by name, have shown exceptional literary skill and talent and have done a fine job, particularly when confronted on short notice with a deadline. Copy editor John Robatcek, production editor Chuck Johnstone (who also did most of the typing), artist Bob Irwin, and circulation manager Darryl Roth deserve special credit for their enthusiasm and the many extra hours they devoted to getting the paper out on time. Advisor Bill Ferrell offered helpful suggestions and spent many hours reading copy. Clara Homyer and the office staff exhibited infinite patience and provided technical advice and assistance which helped solve many production problems, especially those occasioned by a cranky typewriter and a tired mimeograph machine. It has been a pleasure to associate with these fine people in the production of the Hi-Lead.

# ANNUAL

Advertising Eds., Jerry Franklin and Ron Anders; Business Mgr. Otto Krueger.

First, thank you all my staff!

Second, thank you, especially Ron Anders, Pete Martin, Bill Sager, Dick Pryor and Len Woike. The help you gave was inspiring, invaluable, and terrific! On your own initiative you fellows did all the hard work which actually made the Annual Cruise possible. Again I thank you.

Harvey Allen, Tom Appel, Ed Barton, John Poppino, and John Tollefson, you each did a superb job on your sections.

I am deeply grateful to all the writers for their presentations. I also want to thank Dave Davis, Terry Rudd, Arn Harmsen, Bob Irwin, Ken Ram-sing, Jerry Franklin, Craig MacCloskey, Otto Krueger, and all others for their assistance.

It took a great amount of extra labor to obtain our beautiful cover photograph. However it was worth it. The dynamic, forceful action and scenery portrayed here are symbolic of our forestry profession. This belongs to us for this picture is of the stuff with which we work daily!

Photo Ed., Ed Barton, Bill Sager, and John Poppino.

I am grateful that we have every 1958 graduating senior pictured. This would not have been so had not my hard-working staff tracked down certain utterly lazy seniors and led them by the hand to have their picture taken!

In summary I think we have a good yearbook although sometimes my staff felt I was expecting too much of them. It was just that I wanted each staff member to be able to look back in ten years and say: "I am proud to have worked on that 1958 Annual Cruise!"

# WATERSHED MANAGEMENT

## *—A CHALLENGE TO FOREST MANAGERS AND TIMBERLAND OWNERS*

by

James T. Krygier

Assistant Professor of Forest Management

School of Forestry

Oregon State College

Watershed management has attracted considerable attention in recent years among foresters and organizations interested in water conservation. Increasing populations require more water and exert heavier pressures on all forest uses. Forest managers must recognize changes taking place and make adjustments in management to fit these new conditions.

Watershed management has many meanings to many people. To some it is simply good forest or range management; to others, application of the multiple-use concept with emphasis on water; and to still others, a vague concept with little practical application. A commonly accepted definition is: integrated management of the resources of a drainage basin for the production of usable water and the control of streamflow, floods and erosion. Since there is no control over the climatic supply of water and since water does not stay in place, management of this resource is often more difficult than management of a forest. Then, too, almost every forest activity has some influence on erosion and the quality of water.

Recognition of the need for more intensive watershed management in the United States has come only recently. Regions of water shortage and of forest-or range-attributed flood damage were the first to initiate extensive research or management programs. The first watershed research began at Wagon Wheel Gap, Colorado in 1910, and since then numerous intensive studies have been started in the East and in portions of the arid West. The Pacific Northwest is the last watershed frontier, and the search for basic knowledge here is just beginning.

Sound watershed practices have been slow to evolve even where research programs have been established for 30-50 years. It is often said that more basic research is needed before any watershed management can be undertaken, but intensive research is not a requisite for beginning a watershed program. If the ideal of crystal-clear water and no soil movement were considered a necessary objective, then indeed watershed programs would be difficult or impossible to accomplish without intensive research as a forerunner. However, most watershed protection objectives can be met with little or no expense to the landowner or operator through proper pre-planning, careful operations, and adequate road and area maintenance. Difficult situations do exist on rough topography and erosive soils and it is here that answers must be forthcoming from research.

There are more basic reasons, such as the following, why application of watershed management has been slow in the Pacific Northwest—even by governmental agencies interested in multiple-use. (1) Practices having detrimental effects on water were unnoticed; populations were small, and the use and recognition of water values were concurrently at a low state. (2) There is no immediate return for additional steps taken to protect streamflow. (3) Water is a resource belonging to the people and controlled by the state. (4) Watershed management has been thought of as a theoretical science with little practical application. (5) Where lands are being managed for a dominant resource there is a tendency to overlook other values.

Application of watershed practices should be no problem to government agencies, since they are managing resources for the public and have accepted watershed management as part of their program. The most difficult and perplexing problems are those faced by the private landowner who must be guided by self-interest to remain in business. In some ways the needs of the public must be met through cooperative efforts. Herein lies the real challenge of accepting and applying watershed practices.

The population of Oregon has been growing, and with it public use and interest in the water resource. Subjects of only temporary concern ten years ago now are of great interest: floods and their causes; debris damming streams or coming to rest on what were once unpopulated flood-plains; erosion and loss of soil; sediment and its effect on the fishery resource; water shortages even in western Oregon; and other innumerable water-use problems, some not directly concerned with watersheds used for timber production and grazing.

Scores of organizations such as the Society of American Foresters, rod and gun clubs, garden clubs, Izaak Walton chapters, and League of Women Voters have an interest in water conservation and often use water problems for organization projects. They are keeping sensitive and watchful eyes upstream. The increasing interest is exemplified by the proposal of a detailed law to regulate logging practices by an Oregon conservation organization. A substantial increase in population is predicted for the next 20-30 years and with it resource managers and users can expect a more critical public with considerably greater political influence.

Progressive thinkers in the forest industry see the handwriting on the wall. Practices detrimental to the public interest, once overlooked, are not likely to be overlooked in the future. The State Sanitary Authority and the Fish Commission have recently

stated policies based on stricter interpretation of existing laws. Unless the challenge of changing conditions is recognized, and steps are taken to promote reasonably sound watershed practices, it is probable that tighter legislation to regulate the forest industry and other watershed operators will come to pass with the increase in political influence of downstream water-users. A few progressive organizations are not likely to halt the trend toward greater government regulation, but an industry carrying out watershed programs in an informed and unified way will have a profound effect.

Immediate reaction to a watershed program which produces no income and sometimes increases costs is often negative. But where public interest is involved, the alternatives are regulation, subsidy by government, or absorption of costs in the end product. To the forest industry certainly the latter is preferable.

What are the additional costs involved in watershed practices? Since the primary controversial forest watershed problems in Oregon boil down to erosion caused by roads and logging, and sediment and debris production, obviously these must be minimized. The adaptation of practices sponsored by the Columbia River Section Watershed of the Society of American Foresters should result in effective damage reduction at a minimum of cost. More will be required where roads are located or cat-logging is done on erosive soils on steep topography. The mere recognition of the erosive power and carrying capacity of water, proper location of roads and skid trails, careful use of equipment, and the use of water bars and otherwise bedding-down an operation will eliminate severe erosion and sedimentation. In most cases costs will be negligible, in others the cost will be slight enough to absorb as a good neighbor, in others the cost may be so high that no private landowner should be required to pay the cost.

Cooperative action is the most logical means of obtaining sound watershed practices, an approach not new to the forest industry. Over 50 years ago, under the leadership of George S. Long of Weyerhaeuser Timber Co., the state fire control and conservation laws were championed by progressive leaders of industry. Many of these programs were initiated at a time when our main timber stands were extensive with no foreseeable end of the supply. The situation with watershed management is somewhat parallel to the forest conservation situation then. In 1909, E.T. Allen as forester of a new industry-led association said: "It is only a matter of time until private as well as public lands must come under conservative forestry management and protection. The public... is bound to come to consider the ownership of so vital a resource as a public trust. It will have an interest before which no private interest can stand. We see the handwriting on the wall... It is high time for the timber owner to recognize this... Like all good generals, he must avoid the weakness of a forced defense, and already he is dangerously near it... let the private owner lead the movement." Education and cooperative action are the most desirable and logical means to approach our watershed problems. History indicates that when needs and objectives have been made clear the forest industry will meet the challenge.

# NEW OREGON FOREST RESEARCH CENTER

by Jim Overholser

Technical Editor for the Oregon Forest Research Center

Scientist staff members of the state's Forest Products Research Center and Forest Lands Research Center in the new all-wood headquarters at Corvallis report much progress in solving problems of growing and protecting the timber crop and in making the most of timber produced.

"Only from a clear understanding of intricate relationships of biotic and climatic factors in a forest community can foresters hope to manage the resource with maximum efficiency," maintains Dick Berry, Director of forest lands research.

John B. Grantham, Director of forest products research, emphasizes that wood scientists seek to increase returns from the state's timberlands by finding uses for residues, improving products, reducing losses, and developing new products.

Work of the two research crews, supported by a severance tax of four cents a thousand board feet on logs harvested in the state, is expected to gain impetus from efficient, close cooperation. Economy is expected to result from housing both organizations in one building, with a single crew for maintenance and business affairs, according to R. M. Kallandar, Administrator for the Forest Protection and Conservation Committee, which oversees expenditures.

## FOREST PRODUCTS RESEARCH

Work of the wood technologists includes study of wood chemistry, physical properties, preservation, seasoning, and products such as pulp and paper, fiberboard, particle board and plywood. Products range from brief investigations or tests requiring only a few

hours to long-term studies of durability of wood in service that may extend over many years.

Much has been done to point out availability of wood residues and minor species and suggest economic means for their utilization. Millions of tons of residues now find profitable use, but more millions are available, as yet unused except for fuel. In a few years, hardboard has become an important product in the state, and particle board is growing in importance. Use of mill residues for pulp has increased tremendously. Tests of properties and studies of manufacturing variables continue to aid growth of these industries.

Treatments to increase resistance to insects, fungi, or fire and tests to establish data for construction engineers and architects are expected to aid modern technology in making ever more useful products from our timber crop.

Several of the wood researchers have graduated from, or have been associated with, OSC's School of Forestry. Jack Grantham, Director, was formerly in charge of the Forest Products Department, and Jim Snodgrass, Associate Division Chief, was Associate Professor in Forest Products.

Bob Graham, in charge of wood preservation, received his M.S. in Wood Products at OSC in 1947. Jim Johnson, in charge of timber mechanics, received his M.S. in Wood Technology in 1951.

Chuck Burrows, class of '53, is working in the Manufactured Products Department, and Jim Overholser, class of '50, is technical editor.

Two more staff members are graduates of OSC, but from the School of Engineering. They are George Atherton and Stan Corder, both mechanical engineers, class of '50.

Research in Forest Lands and Forest Products will be housed in this new, all-wood, building on Philomath Road in Corvallis. With a floor area of about 40,000 square feet, and a combined crew of wood and forest scientists of about 35, the building cost \$500,000. (Photo by Oregon Forest Products Research Center)

## FOREST LAND RESEARCH

Work of the Forest Lands Research Center staff includes studies of seeds, seedlings, forest fires and fire weather, insects, diseases, mammals, soils, and genetics.

Dick Berry, Director, says his objective is to maintain an able staff of foresters with advanced training, to coordinate the work of the basic scientists in solving important problems. Scientists basic to forestry on his staff are an entomologist, a pathologist, a mammalogist, a geneticist, a plant physiologist, a meteorologist, and a soils scientist. "It is particularly fortunate that most of the specialists have also had general forestry training, several of them at OSC," says Berry.

One recent development of the Forest Lands program is a hybrid of Douglas-fir and big-cone spruce. The purpose of attempting the cross was to develop a tree with an improved root system. Seedlings are now one year old and already show superior root development. They also are considerably taller than wind-pollinated seedlings from the same parents.

A Douglas-fir seed provenance study is another feature of the program. Foresters from British Columbia, Washington and Oregon are cooperating in testing seedlings from the northern extremity of the Douglas-fir range in British Columbia to southern Oregon. In all, there are 16 separate seed sources and 16 outplanting areas. Each outplanting area will contain seedlings from all sources. One planting will be on the McDonald Forest. The staff physiologist, pathologist, entomologist and other specialists will make a careful analysis of all the factors concerned with the response of seedlings from each seed source to the environment.

Some other active projects of the Forest Lands staff are: thinning young stands from 10 to 50 years old; fire climatology; seedling damage by animals; Douglas-fir beetle microclimate; and soil microbiology.

Dale Bever, Associate Director, received both Bachelor's and Master's degrees from OSC. Alan Berg, who heads the stand managements studies, and Director Berry were in the OSC class of '41. Ernest Wright, pathologist, is also an OSC forestry graduate who attained advanced degrees at the Universities of California and Nebraska. Other schools represented are the University of Central China and Michigan State, by Kim Ching, geneticist; the University of Prague, by silviculturist Fedor Kudrjavcev (a student there of Dr. Wilde); the University of Tartu in Estonia, by Rudolf Kangur; North Carolina State, by Max Halber; the Universities of North Carolina and Washington, and Washington State, by both Denis Lavender, physiologist, and Ed Hooven, mammalogist; and the Universities of Cincinnati and Wisconsin, by meteorologist William Lowry.

Kim K. Ching, geneticist, (right) discusses Douglas-fir seed provenance study with Charles L. Dougherty in planting at State nursery near Corvallis. Dougherty, a senior at OSC, will assist Ching after graduating in June 1958. (Photo by Oregon Forest Lands Research Center)

John B. Grantham, Director of Forest Products Research Center in Corvallis, (right), watches as James D. Snodgrass staples crossed thin lumber in web of fifth-scale model of roof truss for Portland E-R Center. Full-scale model will be 360 feet long, and made of glued laminated timbers and lumber panels. (Photo by Oregon Forest Products Research Center)

# THE LIFE OF THE

Strangely, most readers of the Annual Cruise are not now attending OSC's School of Forestry. This section is presented for the benefit of these readers to give them a better insight into the schooling and life of a modern Fernhopper.

The life of a Fernhopper is a very busy life. He truly has to be dedicated, for his learning goes on twelve months out of the year. Amongst these Fernhoppers a strong bond of comradeship and fraternity develops since so much of their time is spent together in study and work.

Since he is so busy in school he has little time left for athletics; however when he does play he finds physical expression in outdoor pastimes such as burling, chopping, saw bucking, speed climbing, skiing, swimming—.

Our modern Fernhopper has chosen a man's profession and he's proud of that. Understandably he's quite happy for he feels what more could a man ask for than to be comparatively free and to work in God's great outdoors. The following pictures portray his life:

2. Mapping is learned by plotting and drawing maps from his own field notes;

## IN THE CLASSROOM

1. He learns in the classroom from lectures and discussions;

3. Intricate problems are solved in timber mechanics;

4. And he also has practical field projects in timber cruising, cadastral surveying, mapping, road design, growth determinations, and logging layout. All this field data must be computed and then compiled into reports, plans, maps, plats, graphs, and diagrams;

# FORESTRY STUDENT

5. Scaling is learned on the pond as well as in the classroom;

6. Field trips are taken to sawmills, logging shows, paper mills, plywood plants, Forest Service Experiment Stations, the Tillamook Burn, etc.;

## IN THE FIELD

7. Rain or shine he has all-day field labs on nearby 6,000-acre Mac Donald Forest. He studies regeneration, soils, forest practices, and also here obtains field data for his projects;

8. On these labs he becomes proficient in the use of the staff compass, abney, transit, theodolite, plane table, and dumpy level;

# EXTRACURRICULAR

10. He tries to run the boom logs;

9. He competes in log burling;

11. He works on our student publications;

12. He has dances and picnics with the girls at the cabin;

13. He makes models of logging machinery;

14. And he goes skiing up in the Cascades;

# ON THE JOB

16 He may get experience in logging;

18. He may fight brush fires on Southern California watershed;

15. He may parachute into the wilderness areas of the west to fight fires as a smokejumper;

17. He may work as a log scaler;

19. Or he may do the preliminary surveying and planning of access roads.

Every summer he works in forestry to gain needed experience and to learn. He is graded critically on his performance during each of these summers. This grade is far more important than his grades in school courses because it demonstrates how well he actually works out in the profession.

Whatever his job during the summer, whether it is logging, fire fighting, bug spraying, research, cruising, forest road engineering, logging layout, etc.; it is sure to be filled with work and also very interesting.

In summary we see that the life of a Fernhopper is a busy life, but it is also a very rich life.

# WE PRESENT STAN LYON

"Once back in the thirties when I was climbin' for one of Weyerhaeuser's camps out of Longview, we had two pet cub bears fixed up in one of the empty bunkhouses. They were fixed up real nice too; we even had a little tree for them to climb around on. Anyway just after supper this one night I was headin' 'cross camp to play with the bears when I spied the old yellow camp cat. 'H'mm', I thought, 'I wonder what would happen if I tossed the cat in with those bears.' So I put on my canvas gloves, grabbed the cat, and packed him over towards the bunkhouse. He cuddled up in my arms and purred away real contentedly; that is, until I got about ten feet from the door. Then he smelled the bears; that cat literally went crazy; Every hair on him stood on end. He fluffed up so much that it looked like I was holding a cougar in my hands! I made a run at the open door, but the cat grabbed hold of both sides and held on. I backed off and made another run at it. No luck. Then I tried holding him different ways and pushing him through. No matter which way I came at the door, the cat would grab hold of one side and then stretch twice his length out with another paw and grab the other side. He held on like he was trying to pull the walls down. Pushing against him was like pushing against a big spring. Finally my brother Vic grabbed his rear legs and I grabbed his front legs; then we heaved him in and slammed the door. We all watched through the window; there were the two cub bears sitting on their haunches in the middle of the floor all unconcerned. It was like a merry-go-round; that cat ran around and around the room wild-like, ricocheting off the walls. Then he'd climb the walls and try to run across the ceiling; he reminded me of one of those motorcycles in a barrel at the carnival. Those bears just sat there with a curious expression on their face, their heads swiveling back and forth, watching him just like as if they were watching a ping-pong game. Then the cat started clawing at the crack beneath the door like he was going to rip the door off. We finally pushed the door open and stepped out of the way as this yellow streak shot by. That poor cat would never go within a hundred yards of that bunkhouse again."

This is Stanley Lyon, 1955 World's Champion High Climber telling one of his innumerable logging anecdotes in his own interesting vernacular.

Stan descends from a family of loggers of the old breed who were skilled craftsmen in the use of the axe and saw. His father, a tall, huge man, and also very religious, spent most of his life falling giant old-growth timber. He was of perfectionist nature and took great pride in the art of precision falling; he passed this skill on to Stan. Stan went to work in the woods at the age of fifteen in 1929. Soon after this he started topping trees. This was

the period when 'highball' logging was in its greatest glory. Giant skidders, the largest most powerful logging machines ever invented, were used with a skyline that reached out over 2000 feet. Log production was the most important thing and nobody worried greatly about safety. Stan climbed, topped, and rigged for these skidders. For several years he worked at nothing but topping 'tail' trees for Weyerhaeuser's different skidders in the Longview area. The schedule he worked at was four trees a day to be topped.

During these years it was his father's early training in falling that kept Stan from getting into trouble with his tree topping. Stan used the same care and attention to detail in his topping as his father did in his falling and it stood him in good stead.

Once a young boy in camp pestered Stan to teach him how to climb. Stan consented and spent the first week training him how to work his spurs, flip his rope, and limb as he climbed up the tree. However the lad hadn't progressed enough to be taught how to top. After just a week of training, unbeknown to Stan, the boy hired out as a climber for another logging outfit. When the boy attempted to top his first tree it split on him! He was crushed in his rigging!

Another time Stan was up in an old-growth about a hundred feet. He unsnapped his rope to pass over a thick cluster of big burly limbs. After weaving his rope in and out above him he tried to resnap his rope. It was caught up and he couldn't get enough slack to resnap it. For over twenty minutes he hung by his hands till they cramped on him. Then he put the rope in his teeth and tried to relax his hands. This drama was being witnessed by a whole skidder side. They stopped logging but couldn't help because there was no other climbing rigging on the side. After almost forty minutes of hanging by his hands and teeth with his eyes full of needles Stan worked his rope free and got above the branch cluster. Ever since then Stan has climbed with two ropes leaving one tied in while he passes over the limbs with the other.

In 1939 and 1940 Stan quit the woods and went cowboying with his brother Vic. First they worked as riders for ranches in Nevada and Arizona. They even rode as the bad men in several western movies which were being filmed in Arizona. Later on they took to the rodeo circuit and made their living by riding broncs and Brahma bulls in various rodeos around the west. Stan's specialty act was to ride facing backwards on a bucking bronc. On the rodeo program he was billed as 'Suicide Stan'. He learned the rodeo game fast and in 1939 he placed high up in the money at the big Cheyenne Rodeo.

Above: This is Stan topping a tree for Oregon's Lewis and Clark Sesquicentennial Celebration in 1955. This scene depicts a phase of the state's billion dollar timber industry. This industry alone accounts for 65% of Oregon's income. This picture also symbolizes the type of man it takes to log this giant timber. (Photo by Les Ordeman, courtesy Oregon Journal)

To the left: Stan is pictured here after winning the World's Champion High Climber title at the Albany, Oregon Timber Carnival in 1955. (Courtesy Oregon Journal).

Soon after, the woods called him back and he went back to topping trees for Weyerhaeuser again. Early in 1942 he joined the Navy. Just after boot camp he entered the All-Navy Wrestling Tournament. He won the 175-pound championship.

Then he was transferred to Pearl Harbor as a judo instructor. This was good duty, but he was afraid that the war would end before he saw any action. So he volunteered for destroyer duty. After thirty months of straight action and many battles, Stan's ship was one of three destroyers left out of the original thirty-three in the task force.

In 1946 he was discharged and went back again to work in the woods. His brother Vic was home too after being wounded in action in Europe.

As they teamed up together to work at falling they considered themselves lucky to have both come out of the war alive. One day they fell a big old-growth into the sun. As it fell it struck the top of a snag and flipped the snag's top backwards. Stan and Vic were standing not two feet apart and couldn't see the falling top because of the sun. It landed on Vic-----! He died in Stan's arms as he carried him to help-----!

Vic's death came ironically not six months after they both had gotten out of the war. Stan's remorse was such that he did not recover himself for almost a year. This accident caused him to do a great amount of thinking about making woods work safer.

Shortly after this Stan went to work for Atlas Logging Company and it was here that he topped and rigged one of the largest spar trees that he has ever seen. The tree tapered very little; he topped it at 225 feet where the diameter was 37 inches.

After working as logging superintendent for several logging outfits in the Tillamook and Mapleton, Oregon area respectively he joined the Oregon State Industrial Accident Commission in 1951. He is Assistant Supervisor for the Commission in the Pendleton area now.

He has competed in the various timber carnivals around the Pacific Northwest during the last six years and he has had many trophies to show of his successes. He holds the world's champion topping record at the Albany Timber Carnival. His time is one minute and thirty-six seconds. Time starts when the climber is on the ground and ends when he has cut the top off the 100 foot pole. Stan feels that the spectacular speed race up-and-down the 100 foot poles at Albany is about equal to the danger in riding the pitching back of a Brahma bull. Stan has been censured by people who have witnessed his daredevil capers and wild cable let-down from the top of the 100 foot poles. These people ask how he expects to teach safety after exhibitions such as these. Stan's reply is: "If any worker would devote as much time thinking and planning to his job as I do on that cable let-down, well, then there would be no accidents."

After almost thirty years of work in the woods, rodeoing, athletics, flying, and other adventurous pursuits, the worst injury Stan has sustained is a dislocated shoulder in a parachute jump. This is quite a tribute to Stan's inborn safety intuition and alertness. From his own experiences he feels he could write a considerable manuscript on that all important last half-second. He feels that how a person reacts in this last period of time means the difference between life and death.

Stan has topped with axe and handsaw over 2500 trees. This includes topping cuts as big as 56 inches in diameter. He does not believe in using a chain saw in a tree. His feelings were further strengthened on this after a young climber was killed when he sawed his rope in two with a chain saw in 1955. The fact that Stan has never had a split or a "barber chair" attests to his skill. However he almost always cable wraps the tree against both of these hazards.

It was my good fortune to have Stan teach me how to climb and top. He was very attentive to having me get above the big limbs before cutting them off, to setting the undercut properly, to side notching, and to cutting the corners on my topping cut. Although I was scared, there was a great feeling of safety in being taught by this old master.

It is also a pleasure to listen to Stan tell logging stories of the distant past. One of his is: "I always wanted to be able to stand on top of a spar pole after I had topped it. So one day after topping one about three feet in diameter I waited until it settled down, then real gingerly eased up on top of it and stood up. I didn't feel a bit safe; so I would tie the long tail of my rope around the tree whenever I tried it after that. One day I was topping an exhibition tree for a bunch of high school kids out of Longview. I had everything ready, just waiting for the kids to show up. The tree was notched, the back cut was started, and the long tail of my rope was tied. When the kids arrived I started sawing. There were three bus loads of them, so I decided I would really give them a good show. When the top went, I waited until she broke loose and then scrambled up on top of the whipping pole. They couldn't see the rope because I was holding it behind me, so I just rode out the sway holding onto the rope like I was riding a surfboard backwards. From the ground only the stouthearted were able to watch. This incident created a little sensation around the Longview area.

Once after I had topped a tree I decided I'd try and stand on my head, so I put my head on the bottom of the undercut and my hands on the back of the undercut and then did a half hand-stand and a half head-stand. In this position it was a pretty safe trick. Unbeknown to me Clyde Corman, a superintendent out of the Longview division, came around a turn on the speeder and stopped to watch. Clyde's report back to camp was this: 'I always thought that Lyon was a showoff and could only perform before a crowd, but do you know what? There he was out there in the woods today all alone standing on his head on top of a spar pole.' Stan adds with a smile. "What Clyde didn't know was that I was practicing up to show off before a crowd."

In coming years when we have moved into a second growth economy the loggers will look back on the rough, dangerous days of 'highball' logging with a reminiscence tendered by years. In speaking about the 'tall and uncut' they will recall with almost legendary acclaim Stan who was a champion climber, great story teller and who by acts, deeds and his very life has demonstrated how the hazardous and dangerous can be done correctly and safely. I also salute this illustrious individual for his work in safety—he has helped to make the timber industry a better, safer place to work.

Ray Schenck

# OUR ADVERTISERS

Mount Jefferson in November.

Great need and dependence of the Annual Cruise upon its advertising subscribers has been graphically illustrated during this year of recession and soft lumber markets. The response received from paid advertisers is extremely gratifying. I sincerely and wholeheartedly urge both student and alums alike to patronize our loyal advertisers.

SUPPORT THOSE WHO SUPPORT US!

Sincerely,  
Ray Schenck, Editor

**Important:** The beautiful color photograph on the cover can be scratched and defaced if abused. The blue sky and white mountain are especially susceptible to finger nail scratches. One means of protecting it is to place over it another cover of clear acetate.

Another way, which sharpens the picture and stiffens the cover, is to spray it with a very thin coat of clear lacquer from a ready-pressurized can. Protect the book and binding from the spray, spray from about 15 inches, don't let it run, and coat it several times to get a uniform coat.

*You  
and Georgia-Pacific  
have a big stake in  
big timber...  
and good timbermen*

Young men with vision... and companies with faith in the future... stand together on the threshold of Tomorrow. And the promise is exciting!

Today in 1958... as for years gone by... The Story of America is one of vision. The growth of Georgia-Pacific Corporation is a typical chapter: humble beginning, quality products, public acceptance, sound growth.

To you who know and love the forests... who possess the talents and fervor to continue the development of this renewable natural resource for Mankind's benefits... *a sincere salute from Georgia-Pacific.*

## *Successful operators rely upon* **WASHINGTON TRAKLOADERS for profitable logging**

No other machine in the woods matches the Washington Trakloader in mobility, maneuverability, travel speed, one man ease of operation, ability to yard and load and power and stability to handle even the biggest logs.

It's little wonder that owners throughout the logging industry regard Washington Trakloaders as today's best investment in assuring tomorrow's profitable operation.

Washington Trakloaders are available in sizes and boom styles to match the job, on crawlers or rubber tired undercarriages.

## forest products for tomorrow are growing on tree farms today...

*Quality homes of wood are still America's best building buy. Many of the finest are built of beautiful west coast lumber sold under Weyerhaeuser's 4-Square trademark.*

All across America, tree farm lands that were harvested to provide wood for past and present generations are green with growing trees. Rooted in rich forest soil amid the stumps of their elders, these new timber crops will supply an abundance of useful forest products to meet *future* needs. This pattern of harvesting and restocking can go on indefinitely through proper management of commercial timberlands.

Forestry techniques used on Weyerhaeuser tree farms, for example, are intended to maintain a perpetual balance in the cycle of tree growth and harvest. By measuring the amount of new wood being grown on company lands, our foresters are able to establish the volume of merchantable timber to be cut. After each harvest, the land is put back into production through planned reforestation programs. These practices, together with constant protection against fire, insects and disease will enable our timberlands to produce a continuous flow of wood...*forever*.

The prophecy of a steady rise in the future demand for wood emphasizes the importance of good forestry today. *Write us at Box A, Tacoma, Wash., for a free booklet on industrial forestry, Promise of the Trees.*

## CARCO EQUIPMENT FITS SUSTAINED YIELD LOGGING...

**F**ORESTERS have found a Carco winch with Carco crawler or rubber-tired arch and tractor the most versatile rig in the woods for harvesting and conserving timber. That's true on tree farms or elsewhere, whether you're clear cutting or selective logging. Because of its great maneuverability, this smooth-working tractor equipment operates with minimum damage to standing trees and minimum expense for access roads. It efficiently and economically bunches and yards large or small timber. It reaches out for isolated logs and winches them in from inaccessible spots.

Wherever you may practice forestry, you'll find Carco winches and arches used by leading loggers and sold and serviced by prominent tractor dealers. You'll find, too, that Carco logging equipment is rugged and dependable with unusual staying power.

## ...best-known name in the woods

MEN IN THE WOODS EVERYWHERE have learned that they can *rely* on ESCO cast alloy steel logging tools — from Bardon Choker Hooks to 25-ton capacity Log Grapples. They *know* from experience ESCO logging equipment makes their jobs easier, safer and more profitable.

Pioneering the development of logging equipment for over 40 years, ESCO is still helping set the pace for logging progress — by designing new, safer, more efficient logging tools, and by constantly improving present equipment. You, too, will find that ESCO is the *best known name in the woods*.

**FREE!** New, up-to-date ESCO Logging Rigging Catalog gives details on the full line of ESCO Logging Rigging and Equipment. Write for your copy today.

# OREGON<sup>®</sup> SAW CHAIN PLAYS IMPORTANT ROLE IN MODERN LOGGING

OREGON Saw Chain Division of OMARK Industries, Inc., 9701 S.E. McLoughlin Blvd., Portland 22, Oregon. This ultra-modern OREGON saw chain factory is the largest in the world. Other plants in Guelph, Ontario; Cincinnati; Sweden; Japan.

## OREGON Chipper Chain

A fast-cutting, easy-to-file, all-purpose cutting chain. Factory equipment for 37 of 41 American chain saws. Standard replacement chain for all chain saws.

## OREGON Chisel Chain

An exceptionally fast cutting chain for use on a wide range of chain saws. Expert filing required.

## OREGON Crosscut Chain

A fast cutting "scratcher" type chain for limbing, cutting to a line, cutting hard or frozen timber.

## OREGON CHAIN WORLD-FAMOUS

Hundreds of thousands of timber workers in the United States, and increasing numbers of woodsmen in foreign countries, today operate chain saws equipped with OREGON chain.

OREGON chain is manufactured in the largest saw chain factory in the world, using latest methods and equipment. There is an OREGON chain manufactured for every make and model of chain saw. Only finest quality, hardened steel is used in the manufacture of this expertly designed, precision built chain, which carries the chain industry's strongest guarantee for workmanship and materials.

In addition to saw chain, OREGON manufactures chain saw accessories and maintenance equipment, including Armor-Tip<sup>®</sup> Saw Bars • Drive Sprockets • File Holders • Filing Vises • Depth Gauges • "Gaugits" • Chain Breakers • Hand Rivet Spinners • Bar Tenders • Outer-End Handles • Magnesium Wedges.

When buying saw chain or maintenance equipment specify "OREGON." Look for the name "OREGON" on every chain cutter, the big "O" mark of quality on the package.

## Top-quality wire rope is basic to safety

Wire rope must stand up under rugged, heavy-load-moving jobs. A rope that breaks under load can cause injuries to crews or workmen and damage to costly equipment. That's why it is essential to safety for you to choose the right rope for your jobs.

*Such accidents can be minimized by using top quality ropes on your jobs. The rules*

*to follow are simple. First, make sure that the rope you choose for the job has a reasonable safety factor. Second, see that it is properly maintained.*

*Don't be fooled. All brands of rope are not of equal quality. Insist that you get top quality wire rope—buy Wickwire Rope to be sure.*
